```

```
This protein comprises human TAB1, a novel member of the transforming growth factor-beta receptor signal transduction pathway, which activates TAK-1 kinase activity upon binding. Its maino acid sequence was deduced from a cDNA clone (see AAM26706) has obtained from a kidney library; a variant TAB1 (see AAM26706) has set after than Arg at amino acid position 52. Also claimed are: isolated DNA encoding a protein modified by a substitution deletion and/or addition of 1 or more amino acids of the 504-residue (TAB1 sequence, (2) DNA which can hybridise with the 1560 bp TAB1 nucleic acid sequence; (3) isolated DNA encoding a protein comprising amino acids 21-59 or 437-504 of the S04 TAB1 sequence; (4) DNA encoding a fusion protein comprising an above protein or polypeptide; (5) expression vector comprising an above DNA; and (6) host cell, preferably a mammalian or yeast cell, transformed by the cells with a test compound, and measuring the TAK1 kinase the cells with a test compound, and measuring the TAK1 kinase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1 OSPTLTLOSTNTHTOSSSSSDGGLFRSRPAHSLPPGGEDGRVEPYVDFAEFYRLWSVDHG 60

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ô
                                                                                                                                                                                                               transforming growth factor. Beta receptor signal transduction pathway, which activates TRK-1 kinase activity upon binding.

To amino acid sequence was deduced from a cDNA clone (see AAT31175) obtained from a kidney library, a variant TAB1 (see AAM36707) has a rather than Ser at amino acid position 52. Also claimed are: isolated DNA encoding a protein modified by a substitution, delecion and/or addition of 1 or more amino acids of the 504-residue.

TAB1 sequence; (2) DNA which can hybridise with the 1560 bp TAB1 comprising amino acids 21-799 or 437-504 of the 504 TAB1 sequence; (3) isolated DNA encoding a protein comprising amino acids 21-799 or 437-504 of the 504 TAB1 sequence; (4) DNA encoding a fusion protein comprising an above DNC-ein or polypeptide; (5) expression vector comprising an above DNA; and (6) host cell, preferably a mammalian or yeast cell, transformed by the expression vector. Cells expressing TAB1 and TAK1 can be used the cells with a test compound, and measuring the TAK1 kinase activity.
